Hmong Audio Tool

Recording & pronunciation scoring — user guide

UW-Madison · Hmong XLS-R

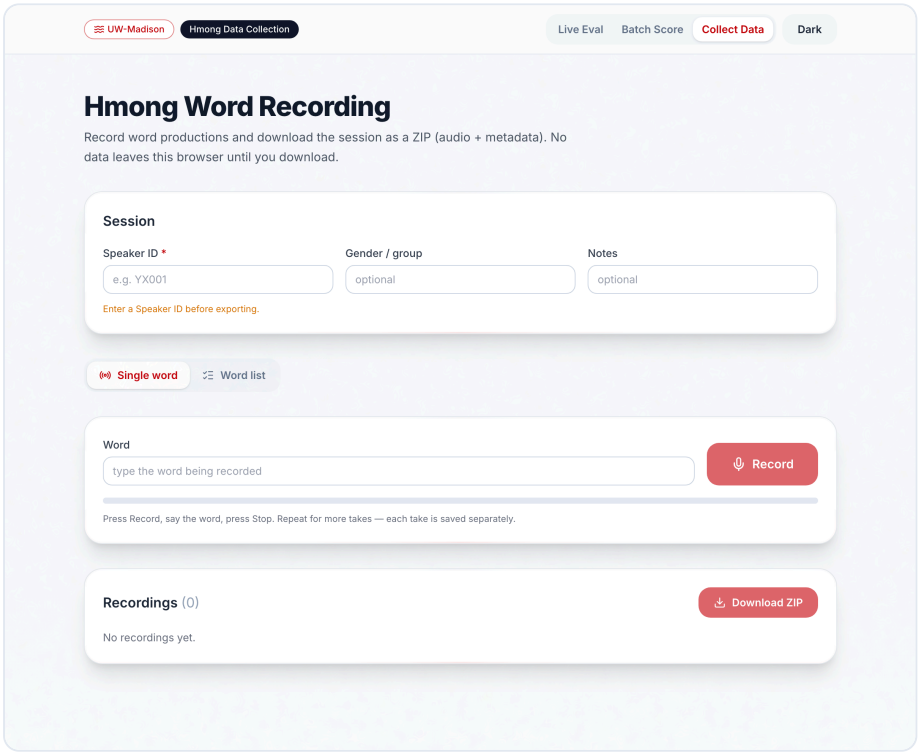

> Three tabs: **Collect Data** (record words in the browser, download a ZIP), **Batch Score** (upload a recorded session, score every recording), **Live Eval** (compare one reference clip with one candidate clip).

You want to…	Tab
Record speakers saying words and save the audio	**Collect Data**
Score a whole recorded session at once	**Batch Score**
Compare one reference with one candidate by hand	**Live Eval**

1 · Collect Data

Records word productions and downloads them as a ZIP (audio + metadata). Nothing is uploaded — the audio stays in the browser until you press Download. Works on laptop, phone, or tablet.

> Recording page: https://fluffy-cactus-f8de18.netlify.app/

The Collect Data tab.

Steps

1. **Speaker ID** — type an ID (e.g. `YX001`). Required before downloading. Gender/group and Notes are optional.
2. Pick a mode:

- **Single word** — type the word, press **Record**, say it, press **Stop**. Record again for more takes; each take is saved separately.
- **Word list** — type words separated by commas (e.g. `dhia, dhiab, dhias`), set the **window** (seconds per word) and **lead-in** (countdown), press **Start**. Each word is shown, counted down, recorded for the fixed window, then it advances automatically.

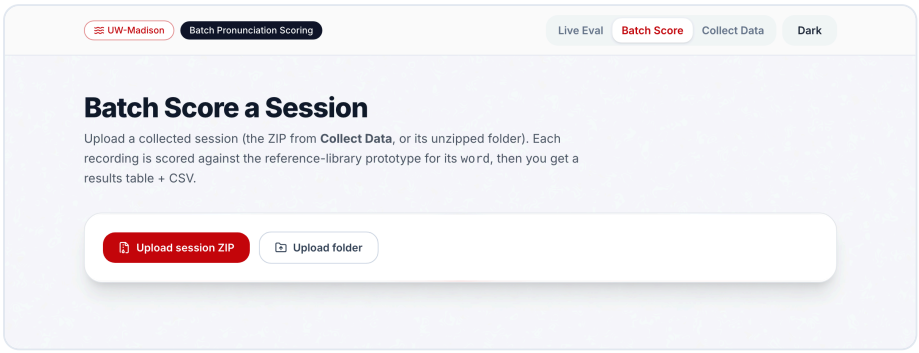

3. Recordings appear in the list below — play, re-record, or delete any of them.
4. Press **Download ZIP** to save `<speaker>_<timestamp>.zip`.

What's in the ZIP

- `<speaker>/<speaker>__<word>__take1.wav` — one WAV per recording
- `metadata.csv` — one row per recording (speaker, word, take, duration, timestamp, …)
- `metadata.json` — the same information as JSON

2 · Batch Score

Upload a recorded session and score every recording at once. Each clip is compared with the reference recordings of the same word.

The Batch Score tab.

Steps

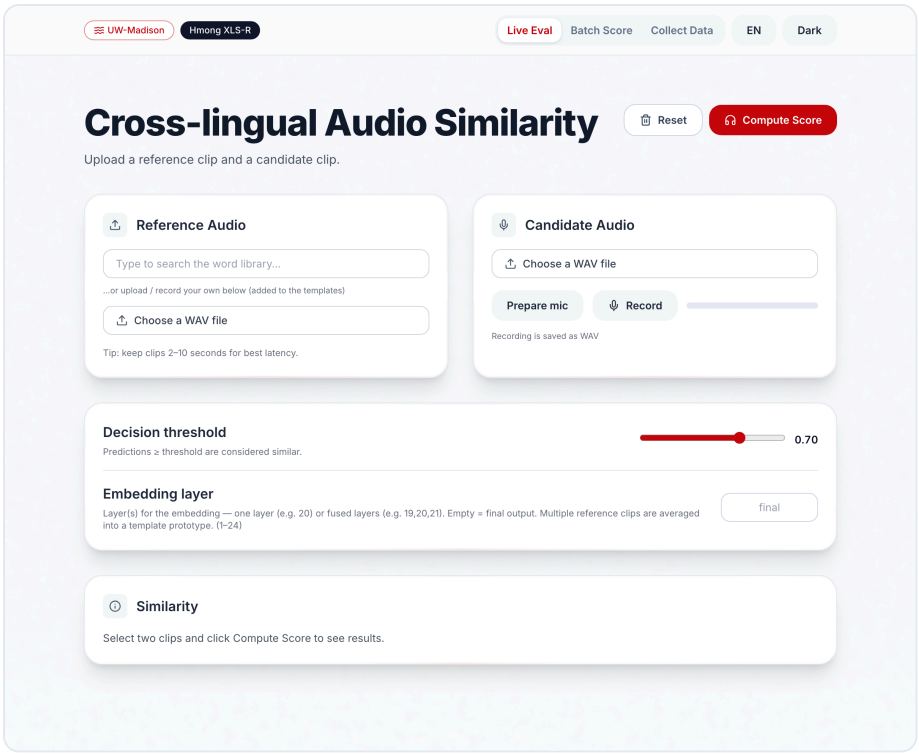

1. Click **Upload session ZIP** and pick the ZIP from Collect Data (or **Upload folder** and pick the unzipped folder).
2. The page reads the metadata and shows how many recordings were found.
3. Set the **Pass threshold**, then press **Score**.
4. Results show as a table — word, speaker, take, score, pass/below — with the mean and pass rate.
5. Press **Download CSV** to save the table.

Reading the scores

Score	A similarity value from −1 to 1. Higher means more similar to the reference recordings of that word.
Pass	Score ≥ threshold. Adjust the threshold to fit your data.
Skipped	The word has no reference recordings, or its audio file was missing.

3 · Live Eval

Compare a single reference with a single candidate.

The Live Eval tab.

- **Reference** — type a word to use the built-in reference recordings, and/or upload or record your own.
- **Candidate** — upload a WAV or record one.
- Press **Compute Score**.
